

FastERP

Accounting Workspace User Guide

Sell, ship, invoice, get paid — and keep balanced books.

Self-contained synthetic demonstration · No Intuit connection

Start FastERP

```
python -m venv .venv
.venv/bin/python -m pip install -r requirements.txt
cp .env.sample .env
.venv/bin/python seed.py
.venv/bin/python web_app.py
```

Open `http://localhost:5011` and sign in as `admin@fasterp.example` / `FastERP2026$`. The data is deterministic and synthetic; rerunning `seed.py` restores the demo baseline.

The left sidebar groups Selling, Buying, Stock and Accounting. Collapse the AI rail when you want more room for reports.

Accounting overview

Open **Accounting → Overview** for the finance cockpit. The KPI row summarizes cash and bank, receivables, payables and net income. Below it, review the current profit-and-loss snapshot, active projects and latest ledger postings.

Use **New expense** for supplier costs and **Journal entry** for controlled adjustments. Every posted workflow writes balanced debit and credit lines.

Record a categorized expense

Choose a supplier and expense account, then enter the net amount. Select a tax code and transaction currency; FastERP converts the posting to GBP using the seeded rate while retaining the source currency.

Optionally assign a **business unit** and **project**. These dimensions flow to the ledger and project profitability report. Add an approval or receipt note, then select **Post expense**.

Post a journal entry

Open **Accounting → Journal Entries → New journal**. Enter a date and memo, then add two or more lines:

1. Select an account.
2. Enter either a debit or credit.
3. Optionally allocate the line to a business unit and project.
4. Confirm total debits equal total credits.

FastERP rejects an unbalanced journal and leaves the books unchanged. Posted journals appear in both the journal register and General Ledger.

Review projects and business units

The Projects page combines customer, owning business unit, status, budget, revenue, costs and margin. Expense and journal allocations update costs immediately.

The synthetic setup includes UK Operations, Continental Europe and North America. Use these dimensions to compare operational areas without creating separate ledgers.

AI Assistant

Run financial reports

Open **Accounting** → **Reports** and switch between:

- **Profit & Loss** — income, cost of goods sold, operating expenses and result.
- **Balance Sheet** — assets, liabilities and equity.
- **Trial Balance** — account debits, credits and normal-side balances.
- **Sales Tax** — taxable purchases and input tax by period.

All reports are accrual-basis and presented in GBP from posted ledger entries.

The screenshot shows the Fast ERP interface with the 'Profit & Loss' report selected. The left sidebar contains a navigation menu with categories: OVERVIEW (Dashboard, AI Assistant), SELLING (Sales Orders, Invoices (AR), Customers), BUYING (Suppliers, Purchase Orders), STOCK (Items & Stock), and ACCOUNTING (Overview, Chart of Accounts, Expenses, Journal Entries, General Ledger, Projects). The main content area displays the 'Profit & Loss' report, which is an accrual-basis report in GBP from posted transactions. It includes tabs for 'Profit & Loss', 'Balance Sheet', 'Trial Balance', and 'Sales Tax'. The report table shows the following data:

Section	Account	Amount
Expenses	Cost of Goods Sold	£648k
Expenses	Marketing Expense	£4k
Expenses	Professional Fees	£10k
Expenses	Rent Expense	£7k
Expenses	Software Expense	£6k
Expenses	Travel Expense	£3k
Expenses	Utilities Expense	£15k
Income	Sales Revenue	£1.08M
Net income		£387k

The interface also features a top navigation bar with 'Chat', 'FASTERP', 'admin@fasterp.example', and 'Logout' buttons, and an 'AI Assistant' button in the bottom right corner.

Configure accounting dimensions

Accounting → Setup lists the seeded reference data:

- GBP, EUR, USD and CAD exchange rates.
- UK, EU and North America business units.
- zero, exempt, reduced and standard VAT codes.
- synthetic receipt images and notes.

Receipt SVGs live under `docs/assets/receipts/`.
They contain no real supplier, person or payment data.

Follow linked operational transactions

Sales invoices post Accounts Receivable, Sales Revenue, Cost of Goods Sold and Inventory. Recording payment moves the balance from Accounts Receivable to Cash. Receiving a purchase order increases Inventory and Accounts Payable.

Use **General Ledger** to filter an account and trace the shared transaction reference, such as **INV-7042**, **PO-6018**, **EXP-8001** or **JE-9001**. This creates a clear audit trail between operational workflows and accounting.

Explore the integration API

Run the API separately:

```
.venv/bin/uvicorn api_app:app --port 5012
```

Open <http://localhost:5012/docs> for Swagger UI. The stub exposes accounts, invoices, expenses, projects, Profit & Loss, Trial Balance and a webhook example. `POST /v1/invoices` validates and previews a payload but deliberately does not post it. The API is a future connector boundary, not an Intuit integration.

Verification and safety

Run `.venv/bin/python -m pytest -q` before changing accounting behavior. Tests assert that seeded books and new postings remain balanced, invalid journals are rejected, and API previews are non-posting.

FastERP is a demonstration, not production accounting software. Exchange rates, tax treatment and reports are illustrative. Never replace the synthetic database or receipt assets with personal, banking or customer production data.
